I. INTRODUCTION

A. RISK FACTORS

i. STANDARD RISK FACTORS

- Investment in Mutual Fund Units involves investment risks such as trading volumes, settlement risk, liquidity risk, default risk including the possible loss of principal.
- As the price / value / interest rates of the securities in which the Scheme invests fluctuates, the value of your investment in the Scheme may go up or down.
- Past performance of the Sponsor/AMC/Mutual Fund does not guarantee future performance of the Scheme.
- The name of the Scheme does not in any manner indicate either the quality of the Scheme or its future prospects and returns.
- The sponsor is not responsible or liable for any loss resulting from the operation of the Scheme beyond the initial contribution of Rs. 1 lakh made by it towards setting up the Fund.
- The present scheme is not a guaranteed or assured return scheme.

ii. SCHEME SPECIFIC RISK FACTORS

Some of the specific risk factors related to the Scheme include, but are not limited to the following:

Risks associated with investments in Fixed Income Securities

- **Interest-Rate Risk:** Fixed income securities such as government bonds, corporate bonds, and money market instruments and derivatives run price-risk or interest-rate risk. Generally, when interest rates rise, prices of existing fixed income securities fall and when interest rates drop, such prices increase. The extent of fall or rise in the prices depends upon the coupon and maturity of the security. It also depends upon the yield level at which the security is being traded.
- **Re-investment Risk:** Investments in fixed income securities carry re-investment risk as interest rates prevailing on the coupon payment or maturity dates may differ from the original coupon of the bond.
- **Basis Risk:** Basis risk arises due to a difference in the price movement of the derivative vis-à-vis that of the security being hedged.
- **Spread Risk:** In a floating rate security the coupon is expressed in terms of a spread or mark up over the benchmark rate. In the life of the security this spread may move adversely leading to loss in value of the portfolio. The yield of the underlying benchmark might not change, but the spread of the security over the underlying benchmark might increase leading to loss in value of the security.
- **Liquidity Risk:** The liquidity of a bond may change, depending on market conditions leading to changes in the liquidity premium attached to the price of the bond. At the time of selling the security, the security can become illiquid, leading to loss in value of the portfolio.
- **Credit Risk:** This is the risk associated with the issuer of a debenture/bond or a money market instrument defaulting on coupon payments or in paying back the principal amount on maturity. Even when there is no default, the price of a security may change with expected changes in the credit rating of the issuer. It is to be noted here that a Government Security is a sovereign security and is the safest. Corporate bonds carry a higher amount of credit risk than Government securities. Within corporate bonds also there are different levels of safety and a bond rated higher by a particular rating agency is safer than a bond rated lower by the same rating agency.
- **Liquidity Risk on account of unlisted securities:** The liquidity and valuation of the Scheme investments due to their holdings of unlisted securities may be affected if they have to be sold

prior to their target date of divestment. The unlisted security can go down in value before the divestment date and selling of these securities before the divestment date can lead to losses in the portfolio.

- **Counterparty Risk:** - This is the risk of failure of counterparty to a transaction to deliver securities against consideration received or to pay consideration against securities delivered, in full or in part or as per the agreed specification. There could be losses to the Scheme in case of a counterparty default.
- **Settlement Risk:** Fixed income securities run the risk of settlement which can adversely affect the ability of the fund house to swiftly execute trading strategies which can lead to adverse movements in NAV.
- **Risks associated with unrated instruments:** - Investments in unrated instruments are subject to the risk associated with investments in any other fixed income securities, as referred above. However, investments in unrated instruments are considered to be subject to greater risk of loss of principal and interest than rated instruments.
- **Duration Risk:** - Duration risk refers to the movement in price of the underlying invested money market / debt instruments due to movement/change in interest rates over different durations of maturity of instruments. In a portfolio of debt assets, the duration risk is measured by the average duration of the portfolio. Duration, expressed in years, is used as a measure of the sensitivity of the fixed income instrument to a change in interest rates. Usually Individual duration of the fixed income instruments in the portfolio is calculated and the portfolio duration is the weighted average of such individual instrument duration. A longer portfolio duration is associated with greater price fluctuations. A rise in interest rates could normally lead to decrease in prices and generally negatively affects portfolios having longer duration vis-a-vis portfolios having shorter duration. A fall in interest rate generally benefits portfolio having longer duration. A longer duration portfolio is also generally associated with greater volatility vis-a-vis a shorter duration portfolio.
- **Performance Risk** - Performance risk refers to the risk of a scheme being unable to generate returns matching / above the returns of the scheme's benchmark. It would also mean the scheme underperforming against its peer set of other mutual fund schemes having similar portfolios, scheme classification, objective, benchmark and asset allocation. The performance risk is a function of various variables which include interest rate movement and the associated price movement of the invested debt/money market instruments, the duration risk, the credit quality movement and the liquidity of the invested instruments. These risks could arise due to a variety of market and economic activities, government policies, global economic changes, currency fluctuations, tax policies, political changes, corporate actions and investors' behaviour.

Risks associated with investments in Securitized Debt

The Scheme may invest in domestic securitized debt such as Asset Backed Securities (ABS) or Mortgage Backed Securities (MBS). ABS are securitized debts where the underlying assets are receivables arising from various loans including automobile loans, personal loans, loans against consumer durables, etc. MBS are securitized debts where the underlying assets are receivables arising from loans backed by mortgage of residential / commercial properties.

At present in Indian market, following types of loans are securitized:

1. Auto Loans (cars / commercial vehicles /two wheelers)
2. Residential Mortgages or Housing Loans
3. Consumer Durable Loans
4. Personal Loans
5. Corporate Loans

In terms of specific risks attached to securitization, each asset class would have different underlying risks. Residential Mortgages generally have lower default rates than other asset classes, but repossession becomes difficult. On the other hand, repossession and subsequent recovery of commercial vehicles and other auto assets is fairly easier and better compared to mortgages. Asset classes like personal loans, credit card receivables are unsecured and in an economic downturn may witness higher default. A corporate loan/receivable, depend upon the nature of the underlying security for the loan or the nature of the receivable and the risks correspondingly fluctuate.

The rating agencies define margins, over collateralization and guarantees to bring risk in line with similar AAA rated securities. The factors typically analyzed for any pool are as follows:

- a. Assets securitized and Size of the loan: This indicates the kind of assets financed with the loan and the average ticket size of the loan. A very low ticket size might mean more costs in originating and servicing of the assets.
- b. Diversification: Diversification across geographical boundaries and ticket sizes might result in lower delinquency.
- c. Loan to Value Ratio: Indicates how much % value of the asset is financed by borrower's own equity. The lower this value the better it is. This suggests that where the borrowers own contribution of the asset cost is high; the chances of default are lower.
- d. Average seasoning of the pool: This indicates whether borrowers have already displayed repayment discipline. The higher the number, the more superior it is. The other main risks pertaining to Securitized debt are as follows:
 - **Prepayment Risk:** This arises when the borrower pays off the loan sooner than expected. When interest rates decline, borrowers tend to pay off high interest loans with money borrowed at a lower interest rate, which shortens the average maturity of ABSs. However, there is some prepayment risk even if interest rates rise, such as when an owner pays off a mortgage when the house is sold or an auto loan is paid off when the car is sold.
 - **Reinvestment Risk:** Since prepayment risk increases when interest rates decline, this also introduces reinvestment risk, which is the risk that the principal can only be reinvested at a lower rate.

Risks associated with investments in Derivatives

- **Market Risk:** Derivatives are traded in the market and are exposed to losses due to change in the prices of the underlying and/or other assets and, change in market conditions and factors. The volatility in prices of the underlying may impact derivative instruments differently than its underlying.
- **Basis Risk:** This risk arises when the derivative instrument used to hedge the underlying asset does not match the movement of the underlying being hedged for example, when a bond is hedged using a derivative, the change in price of the bond and the change in price of the derivative may not be fully correlated leading to basis risk in the portfolio. The underlying benchmark of a floating rate security might become less active or may cease to exist and thus may not be able to capture the exact interest rate movements, leading to loss of value of the portfolio. Example: Where swaps are used to hedge an underlying fixed income security, basis risk could arise when the fixed income yield curve moves differently from that of the swap benchmark curve or if there is a mismatch in the tenor of the swap and the fixed income security.
- **Credit Risk:** The Credit Risk is the risk that the counter party will default in its obligations and is generally small as in a derivative transaction there is generally no exchange of the principal amount.

- **Liquidity Risk:** This risk arises from the inability to sell derivatives at prices that reflect the underlying assets/ rates/ indices, lack of availability of derivative products across different maturities and with various risk appetite.
- **Valuation Risk:** This is the risk of mis-pricing or improper valuation of derivatives due to inadequate trading data with good volumes.
- **Operational / Systemic Risk:** This is the risk arising due to failure of operational processes followed by the exchanges and Over The Counter (OTC) participants for the derivatives trading.
- **Counterparty Risk:** Counterparty risk is the risk that losses will be incurred due to the default by the counterparty for OTC derivatives..
- **Exposure Risk:** An exposure to derivatives in excess of the hedging requirements can lead to losses. An exposure to derivatives can also limit the profits from a plain investment transaction.
- **Interest Rate Risk:** This risk arises from the movement of interest rates in adverse direction. As with all the debt securities, changes in the interest rates will affect the valuation of the portfolios.

Derivative products are leveraged instruments and can provide disproportionate gains as well as disproportionate losses to the investor. Execution of such strategies depends upon the ability of the fund manager to identify such opportunities. Identification and execution of the strategies to be pursued by the fund manager involve uncertainty and decision of fund manager may not always be profitable. No assurance can be given that the fund manager will be able to identify or execute such strategies.

The risks associated with the use of derivatives are different from or possibly greater than, the risks associated with investing directly in securities and other traditional investments.

Risks associated with Real Estate Investment Trust (REIT) and Infrastructure Investment Trust (InvIT):

1. **Risk of lower than expected distributions:** The distributions by the REIT or InvIT will be based on the net cash flows available for distribution. The amount of cash available for distribution principally depends upon the amount of cash that the REIT/INVIT receives as dividends or the interest and principal payments from portfolio assets. The cash flows generated by portfolio assets from operations may fluctuate based on, among other things:
 - success and economic viability of tenants and off-takers
 - economic cycles and risks inherent in the business which may negatively impact
 - valuations, returns and profitability of portfolio assets
 - force majeure events related such as earthquakes, floods etc. rendering the portfolio assets inoperable
 - debt service requirements and other liabilities of the portfolio assets
 - fluctuations in the working capital needs of the portfolio assets
 - ability of portfolio assets to borrow funds and access capital markets
 - changes in applicable laws and regulations, which may restrict the payment of dividends by portfolio assets
 - amount and timing of capital expenditures on portfolio assets

- insurance policies may not provide adequate protection against various risks associated with operations of the REIT/InvIT such as fire, natural disasters, accidents.
 - taxation and other regulatory factors
2. **Price-Risk:** The valuation of the REIT/InvIT units may fluctuate based on economic conditions, fluctuations in markets (eg. real estate) in which the REIT/InvIT operates and the resulting impact on the value of the portfolio of assets, regulatory changes, force majeure events etc. REITs & InvITs may have volatile cash flows. As an indirect shareholder of portfolio assets, unit holders rights are subordinated to the rights of creditors, debt holders and other parties specified under Indian law in the event of insolvency or liquidation of any of the portfolio assets.
 3. **Interest-Rate Risk:** Generally, there would be inverse relationship between the interest rates and the price of units i.e. when interest rates rise, prices of units fall and when interest rates drop, such prices increase.
 4. **Liquidity Risk:** This refers to the ease with which REIT/InvIT units can be sold. There is no assurance that an active secondary market will develop or be maintained. Hence there would be time when trading in the units could be infrequent. The subsequent valuation of illiquid units may reflect a discount from the market price of comparable securities for which a liquid market exists.

Risks Factors associated with transaction in Units through stock exchange(s)

In respect of transaction in Units of the Scheme through BSE and / or NSE, allotment and redemption of Units on any Business Day will depend upon the order processing / settlement by BSE and / or NSE and their respective clearing corporations on which the Fund has no control.

B. REQUIREMENT OF MINIMUM UNITHOLDERS IN THE SCHEME

The Scheme shall have a minimum of 20 Unitholders and no single Unitholder shall account for more than 25% of the corpus of the Scheme. However, if such limit is breached during the NFO of the Scheme, the Fund will endeavor to ensure that within a period of three months or the end of the succeeding calendar quarter from the close of the NFO of the Scheme, whichever is earlier, the Scheme complies with these two conditions. In case the Scheme does not have a minimum of 20 Unitholders in the stipulated period, the provisions of Regulation 39(2)(c) of the SEBI (MF) Regulations would become applicable automatically without any reference from SEBI and accordingly the Scheme shall be wound up and the units would be redeemed at Applicable NAV. The aforesaid conditions should be complied with in each subsequent calendar quarter on an average basis. In case the Scheme does not have a minimum of 20 Unitholders on an ongoing basis for each calendar quarter, the provisions of Regulation 39(2)(c) of the SEBI (MF) Regulations would become applicable automatically without any reference from SEBI and accordingly the Scheme shall be wound up and the units would be redeemed at Applicable NAV. If there is a breach of the 25% limit by any Unitholder over the quarter, a rebalancing period of one month would be allowed and thereafter the Unitholder who is in breach of the rule shall be given 15 days notice to redeem his exposure over the 25 % limit. Failure on the part of the said Unitholder to redeem his exposure over the 25 % limit within the aforesaid 15 days would lead to automatic Redemption by the Mutual Fund on the Applicable NAV on the 15th day of the notice period. The Fund shall adhere to the requirements prescribed by SEBI from time to time in this regard.

In terms of SEBI Circular No. CIR/IMD/DF/05/2014 dated March 24, 2014, since the investments in short term deposits of scheduled commercial banks is allowed, pending deployment of funds of a scheme shall also be excluded while calculating sector exposure.

Pending deployment of the funds in securities in terms of investment objective of the Scheme, the AMC may park the funds of the Scheme in short term deposits of the Scheduled Commercial Banks, subject to the guidelines issued by SEBI vide its circular dated April 16, 2007, as may be amended from time to time.

The Scheme may deploy upto 100% in cash / cash equivalents (including CBLO and Reverse Repo in government securities), in case of non-availability of desired debt and money market instruments or if the Fund Manager is of the view that the risk-reward is not in the best interest of the Unit Holders. The Scheme retains the flexibility to invest across all the securities in the debt and Money Market

Instruments. The Scheme may also invest in units of debt and liquid mutual fund schemes. The portfolio may hold cash depending on the market condition. The fund manager can use Derivative instruments to protect the downside risk.

The Scheme may review the above pattern of investments based on views on interest rates and asset liability management needs. However, at all times the portfolio will adhere to the overall investment objectives of the Scheme.

Subject to the SEBI Regulations, the asset allocation pattern indicated above may change from time to time, keeping in view market conditions, market opportunities, applicable regulations and political and economic factors.. These proportions can vary substantially depending upon the perception of the fund manager; the intention being at all times to seek to protect the interests of the Unit holders. Such changes in the investment pattern will be for short term and for defensive considerations only. In case of deviation, the portfolio would be rebalanced within 30 days from the date of deviation. In case the same is not aligned to the above asset allocation pattern within 30 days, justification shall be provided to the Investment Committee and reasons for the same shall be recorded in writing. The Investment Committee shall then decide on the course of action.

12. Securitised Debt Instruments - Securitization is a structured finance process which involves pooling and repackaging of cash-flow producing financial assets into securities that are then sold to investors. They are termed as Asset Backed Securities (ABS) or Mortgage Backed Securities (MBS). ABS are backed by other assets such as credit card, automobile or consumer loan receivables, retail installment loans or participations in pools of leases. MBS is an asset backed security whose cash flows are backed by the principal and interest payments of a set of mortgage loans. Such Mortgage could be either residential or commercial properties.
13. Pass through, Pay through or other Participation Certificates, representing interest in a pool assets including receivables. It represents beneficial interest in an underlying pool of cash flows. These cash flows represent dues against single or multiple loans originated by the sellers of these loans.

The following are certain additional disclosures w.r.t. investment in securitized debt:

i. How the risk profile of securitized debt fits into the risk appetite of the scheme

Securitized debt is a form of conversion of normally non-tradable loans to transferable securities. This is done by assigning the loans to a special purpose vehicle (a trust), which in turn issues Pass-Through-Certificates (PTCs). These PTCs are transferable securities with fixed income characteristics. The risk of investing in securitized debt is similar to investing in debt securities.

However it differs in two respects.

- a) Typically the liquidity of securitized debt is less than similar debt securities.
- b) For certain types of securitized debt (backed by mortgages, personal loans, credit card debt, etc.), there is an additional pre-payment risk. Pre-payment risk refers to the possibility that loans are repaid before they are due, which may reduce returns if the re-investment rates are lower than initially envisaged.

Because of these additional risks, securitized debt typically offers higher yields than debt securities of similar credit rating and maturity. If the fund manager judges that the additional risks are suitably compensated by the higher returns, he may invest in securitized debt up to the limits specified in the asset allocation table above.

ii. Policy relating to originators based on nature of originator, track record, NPAs, losses in earlier securitized debt, etc

The originator is the person who has initially given the loan. The originator is also usually

responsible for servicing the loan (i.e. collecting the interest and principal payments). An analysis of the originator is especially important in case of retail loans as this affects the credit quality and servicing of the PTC. The key risk is that of the underlying assets and not of the originator. For example, losses or performance of earlier issuances does not indicate quality of current series. However such past performance may be used as a guide to evaluate the loan standards, servicing capability and performance of the originator.

Originators may be: Banks, Non Banking Finance Companies, Housing Finance Companies, etc. The fund manager / credit analyst evaluates originators based on the following parameters

- Track record.
- Willingness to pay, through credit enhancement facilities etc.
- Ability to pay.
- Business risk assessment, wherein following factors are considered:
 - Outlook for the economy (domestic and global).
 - Outlook for the industry.
 - Company specific factors.

In addition a detailed review and assessment of rating rationale is done including interactions with the originator as well as the credit rating agency.

The following additional evaluation parameters are used as applicable for the originator / underlying issuer for pool loan and single loan securitization transactions:

- Transaction structure including Par versus premium and credit enhancement
- Reputation of Originator in the market
- Proportion of overdue assets of the pool or the underlying loan, as the case may be
- Track record of servicing of the pool or the loan, as the case may be
- Any disputes or litigations in the originated pools
- Credit quality and rating
- Loan to Value ratio
- Liquidity facility

iii. Risk mitigation strategies for investments with each kind of originator

Risk would be mitigated to a large extent by the critical evaluation parameters mentioned above. Further, Risk mitigation strategies typically include additional credit enhancement, overcollateralization, interest subvention, presence of subordinate tranches, analysing ageing of the pools i.e. how long the loan has been with Originator before securitization etc.

Some of the risks with securitized debt investments and the corresponding risk mitigating strategies are listed below:

Risk mitigation strategy

Limited Recourse, Delinquency and Credit Risk

In addition to careful scrutiny of credit profile of borrower/pool additional security in the form of adequate cash collaterals and other securities may be obtained to ensure that they all qualify for similar rating.

Bankruptcy of the Originator or Seller

Normally, specific care is taken in structuring the securitization transaction so as to minimize the risk of the sale from the Originator not being construed as a 'true sale'. It is also in the interest of

the originator to demonstrate the transaction as a true sale to get the necessary revenue recognition and tax benefits.

Liquidity and Price risk

Securitized debt instruments are relatively illiquid in the secondary market and hence they are generally held to maturity. The liquidity risk and HTM (Held To Maturity) nature is taken into consideration at the time of analyzing the appropriateness of the securitization.

Prepayment Risk

A certain amount of prepayments is assumed in the calculations at the time of purchase based on historical trends and estimates. Further, a stress case estimate is calculated and additional margins are built in.

iv. The level of diversification with respect to the underlying assets, and risk mitigation measures for less diversified investments

In case of securitization involving single loans or a small pool of loans, the credit risk of the borrower is analyzed. In case of diversified pools of loans, the overall characteristic of the loans is analyzed to determine the credit risk.

The credit analyst looks at ageing (i.e. how long the loan has been with the originator before securitization) as one way of judging the performance potential of the PTC. Additional risk mitigants may include interest subvention, over collateralization, presence of an equity / subordinate tranche and / or guarantees. The credit analyst also uses analyses by credit rating agencies on the risk profile of the securitized debt.

Currently, the following parameters are used while evaluating investment decision relating to a pool securitization transaction. The Investment Committee may revise the parameters from time to time.

| Characteristics /Type of Pool | Mortgage Loan | Commercial Vehicle and Construction Equipment | CAR | Two wheelers | Micro Finance Pools | Personal Loans | Single Sell Downs | Others |
|---|----------------|---|---------------|---------------|---------------------|----------------|-------------------|--------------|
| Approximate Average maturity (in Months) | Up to 10 years | Up to 5 years | Up to 5 years | Up to 3 years | Up to 80 Weeks | Up to 3 years | Refer Note 1 | Refer Note 2 |
| Collateral Margin (including Cash, guarantees, excess Interest spread, subordinate tranche) | >5% | >5% | >4% | >4% | >4% | >4% | “ | “ |
| Average Loan To Value Ratio | <90% | <90% | <90% | <90% | Unsecured | Unsecured | “ | “ |
| Average seasoning of the Pool | >3 months | >3 months | >3 months | >3 months | >3 months | >3 months | “ | “ |
| Maximum Single exposure range | <5% | <7% | Retail | Retail | Retail | Retail | “ | “ |
| Average Single exposure range % | <5% | <5% | Retail | Retail | Retail | Retail | “ | “ |

Note 1: In case of securitization involving single loans or a small pool of loans, the credit risk of the borrower is analyzed. The investment limits applicable to the underlying borrower are applied to the single loan sell-down.

Note 2: Other investments will be decided on a case-to-case basis.

The credit analyst may consider the following risk mitigating measures in his analysis of the securitized debt:

- Size of the loan – The size of the loan is generally analysed on a sample basis and an analysis of the static pool of the originator is undertaken to ensure that the same matched with static pool characteristics. It also indicates whether there is high reliance on very small ticket size borrower which could result in delayed and expensive recoveries.
- Average original maturity of the pool – the analysis of the average maturity of the pool is undertaken to evaluate whether the tenor of the loans are generally in line with the average loan in the respective industry and repayment capacity of the borrower.
- Loan to value ratio, average seasoning of the pool of underlying assets – these parameters will be evaluated based on the asset class as mentioned in the table above.
- Default rate distribution – the credit team generally ensures that all the contracts in the pool are current to ensure zero default rate distribution.
- Geographical distribution – the analysis of geographical distribution of the pool is undertaken to ensure prevention of concentration risk.
- Credit enhancement facility – credit enhancement facilities in the form of cash collateral, such as fixed deposits, bank guarantee etc. could be obtained as a risk mitigation measure.
- Liquid facility – these parameters will be evaluated based on asset class as mentioned in the table above.
- Structure of the pool of the underlying assets – The structure of the pool of the underlying asset class or combination of various asset classes as mentioned in the table above. We could add new asset class depending upon the securitization structure and changes in market acceptability of asset classes.

v. Minimum retention period of the debt by originator prior to securitization

Issuance of securitized debt is governed by the Reserve Bank of India. RBI norms cover the "true sale" criteria including credit enhancement and liquidity enhancements. In addition, RBI has proposed minimum holding period before they can be securitized. The minimum holding period depends on the tenor of the securitization transaction. The Fund will invest in securitized debts that are compliant with the laws and regulations.

vi. Minimum retention percentage by originator of debts to be securitized

RBI has prescribed the minimum retention percentage as 5% or 10% of the book value of the loans being securitised depending on the original maturity of the loans and the features of the securitisation transaction.

vii. The mechanism to tackle conflict of interest when the mutual fund invests in securitized debt of an originator and the originator in turn makes investments in that particular scheme of the fund

The key risk is securitized debt relates to the underlying borrowers and not the originator. In a securitization transaction, the originator is the seller of the debt(s) and the fund is the buyer. However, the originator is also usually responsible for servicing the loan (i.e. collecting the interest and principal payments). As the originators may also invest in the scheme, the fund manager shall ensure that the investment decision is based on parameters as set by the Investment Committee of the asset management company and committee shall review the same at regular interval.

viii. The resources and mechanism of individual risk assessment with the AMC for monitoring investment in securitized debt

The fund management team has the required experience to analyse and monitor investments in securitised debts. On an on-going basis the rating movement of the securitised debts will be monitored. Credit research agencies also provide analysis of individual instruments and pools. The periodic reports received by the AMC on pool performance will be scanned to check for any change in asset quality and related impact on debt servicing and any impact that it can have on the credit ratings.

Note: The information contained herein is based on current market conditions and may change from time to time based on changes in such conditions, regulatory changes and other relevant factors. Accordingly, our investment strategy, risk mitigation measures and other information contained herein may change in response to the same.

14. Debt Derivative instruments like Interest Rate Swaps, Forward Rate Agreements and such other derivative instruments permitted by SEBI/RBI.

Interest Rate Swap - An Interest Rate Swap (“IRS”) is a financial contract between two parties exchanging or swapping a stream of interest payments for a “notional principal” amount on multiple occasions during a specified period. Such contracts generally involve exchange of a “fixed to floating” or “floating to fixed” rate of interest. Accordingly, on each payment date that occurs during the swap period, cash payments based on fixed/ floating and floating rates are made by the parties to one another.

Forward Rate Agreement - A Forward Rate Agreement (“FRA”) is a financial contract between two parties to exchange interest payments for a notional principal amount on settlement date, for a specified period from start date to maturity date. Accordingly, on the settlement date, cash payments based on contract (fixed) and the settlement rate, are made by the parties to one another. The settlement rate is the agreed bench-mark/ reference rate prevailing on the settlement date.

Interest Rate Futures:

A futures contract is a standardized, legally binding agreement to buy or sell a commodity or a financial instrument in a designated future month at a market determined price (the futures price) by the buyer and seller. The contracts are traded on a futures exchange. An Interest Rate Future is a futures contract with an interest bearing instrument as the underlying asset.

Characteristics of Interest Rate Futures

1. Obligation to buy or sell a bond at a future date.
2. Standardized contract.
3. Exchange traded.
4. Physical/Cash settlement.
5. Daily mark to market.

15. Investment in Units issued by REITs & InvITs - The Scheme may invest in the units issued by REITs & InvITs subject to requirements specified under SEBI (MF) Regulations.

16. Any other like instruments as may be permitted by RBI/SEBI/ such other Regulatory Authority from time to time.

The securities / instruments mentioned above and such other securities the Scheme is permitted to invest in could be listed, unlisted, privately placed, secured, unsecured, rated or unrated and of any maturity.

The securities may be acquired through initial public offering (IPOs), secondary market, private placement, rights offers, negotiated deals. Further investments in debentures, bonds and other fixed income securities will be in instruments which have been assigned investment grade rating by the Credit Rating Agency.

Investment in unrated debt instruments shall be subject to complying with the provisions of the Regulations and within the limit as specified in Schedule VII to the Regulations. Pursuant to SEBI Circular No. MFD/CIR/9/120/2000 dated November 24, 2000, the AMC may constitute committee(s) to approve proposals for investments in unrated debt instruments. The AMC Board and the Trustee shall approve the detailed parameters for such investments. However, in case any unrated debt security does not fall under the parameters, the prior approval of Board of AMC and Trustee shall be sought.

For applicable regulatory investment limits please refer paragraph "Investment Restrictions". Details of various derivative strategies/examples of use of derivatives have been provided under the section "Derivatives Strategy"

The Fund Manager reserves the right to invest in such securities as maybe permitted from time to time and which are in line with the investment objectives of the Scheme.

E. WHAT ARE THE INVESTMENT STRATEGIES?

In terms of the risk-return profile of the Scheme, the Scheme is positioned above the liquid fund but lower than the short term fund. Hence the portfolio strategy will seek to generate return by having a marginally higher maturity and moderately higher credit risk. The Scheme shall however maintain balance between safety and liquidity.

The fund manager will seek to play out the yield curve and exploit anomalies if any in portfolio construction after analysing the macro-economic environment including future course of system liquidity, interest rates and inflation along with other considerations in the economy and markets.

The Scheme will seek to generate higher returns than liquid fund, hence will tactically invest /exit in higher maturity instruments, which will have a mark to market impact on the Scheme, thereby making it moderately more volatile than the liquid fund. The initiation of the tactical allocation by the fund manager will be according to market conditions to generate alpha. The Scheme may also initiate moderately higher risk credit risk trades, as compared to a liquid fund , after following a robust credit risk evaluation process.

The investment team of the AMC will, as a mitigation and risk control procedure, carry out rigorous credit evaluation of the issuer company proposed to be invested in. The credit evaluation will analyse the operating environment of the issuer, the sector analysis, business model, management, governance practices, quality of the financials, the past track record as well as the future prospects of the issuer and the financial health of the issuer.

Derivatives Strategy:

The Scheme may use Derivative instruments like interest rate swaps like Overnight Indexed Swaps ("OIS"), forward rate agreements, interest rate futures (as and when permitted) or such other

Derivative instruments as may be permitted under the applicable regulations. Derivatives will be used for the purpose of hedging, and portfolio balancing or such other purpose as may be permitted under the regulations and Guidelines from time to time.

The Fund will be allowed to take exposure in interest rate swaps only on a non-leveraged basis. A swap will be undertaken only if there is an underlying asset in the portfolio. In terms of Circular No. MFD.BC.191/07.01.279/1999-2000 and MPD.BC.187/07.01.279/1999-2000 dated November 1, 1999 and July 7, 1999 respectively issued by RBI permitting participation by Mutual Funds in interest rate swaps and forward rate agreements, the Fund will use Derivative instruments for the purpose of hedging and portfolio balancing. The Fund may also use derivatives for such purposes as maybe permitted from time to time. Further, the guidelines issued by RBI from time to time for forward rate agreements and interest rate swaps and other derivative products would be adhered to by the Mutual Fund.

IRS and FRA do also have inherent credit and settlement risks. However, these risks are substantially reduced as they are limited to the interest streams and not the notional principal amounts.

Investments in Derivatives will be in accordance with the extant Regulations / guidelines. Presently Derivatives shall be used for hedging and / or portfolio balancing purposes, as permitted under the Regulations. The circumstances under which such transactions would be entered into would be when, for example using the IRS route it is possible to generate better returns / meet the objective of the Scheme at a lower cost. e.g. if buying a 2 Yr FBIL Mibor based instrument and receiving the 2 Yr swap rate yields better return than the 2 Yr AAA corporate, the Scheme would endeavor to do that. Alternatively, the Scheme would also look to hedge existing fixed rate positions if the view on interest rates is that it would likely rise in the future.

The following information provides a basic idea as to the nature of the Derivative instruments proposed to be used by the Fund and the benefits and risks attached therewith. Please note that the examples have been given for illustration purposes only.

Interest Rate Swaps:

The Indian markets have faced high volatility in debt markets. An interest rate swap is a contractual agreement between two counter-parties to exchange streams of interest amount on a notional principal basis. In this, one party agrees to pay a fixed stream of interest amount against receiving a variable or floating stream of interest amount. The variable or floating part is determined on a periodical basis.

Mutual Funds may enter into plain vanilla interest rate swaps for hedging purposes. The counter party in such transactions has to be an entity recognized as a market maker by RBI. Further, the value of the notional principal in such cases must not exceed the value of respective existing assets being hedged by the scheme.

Example

Entity A has a Rs.50 crores, 3 month asset which is being funded through call. Entity B, on the other hand, has deployed in overnight call money market Rs.50 crores, 3 month liability. Both the entities are taking on an interest rate risk.

To hedge against the interest rate risk, both the entities can enter into a 3 month swap agreement based on say FBIL MIBOR (Financial Benchmarks India Private Limited Mumbai Inter Bank Offered Rate). Through this swap, entity B will receive a fixed pre-agreed rate (say 7%) and pay FBIL MIBOR (“the benchmark rate”) which will neutralize the interest rate risk of lending in call. Similarly, entity A will neutralize its interest rate risk from call borrowing as it will pay 8% and receive interest at the benchmark rate.

Assuming the swap is for Rs.50 crores 1 January to 1 April, Entity A is a floating rate receiver at the

overnight compounded rate and Entity B is a fixed rate receiver. On a daily basis, the benchmark rate fixed by NSE will be tracked by them.

On April 1, they will calculate as explained below:

Entity A is entitled to receive daily compounded call rate for 91 days and pay 7% fixed.

Entity B is entitled to receive interest on Rs.50 crores @ 7% i.e. Rs. 87.26 lacs, and pay the compounded benchmark rate.

Thus on December 1, if the total interest on the daily overnight compounded benchmark rate is higher than Rs. 87.26 lacs, entity B will pay entity A the difference and vice versa.

The above example illustrates the use of Derivatives for hedging and optimizing the investment portfolio. Swaps have their own drawbacks like credit risk, settlement risk. However, these risks are substantially reduced as the amount involved is interest streams and not principal.

Forward Rate Agreement (FRA)

A FRA is referred to by the beginning and end dates of the period covered in the transaction. A 2x5 FRA means the 3 month rate starting 2 months from now.

For example, a corporate has a three month fixed liability three months from now. To meet this liability the company enters into a 3x6 FRA where it receives 7.25% for 100 crore and fixes the interest cost for the 3-6 months period. If the actual three month rate three months from now is 7% the corporate has gained 25 bps through interest cost. As the settlement is done at the beginning of the period, the net present value of the savings needs to be calculated using the 3 month rate as the discount rate.

Interest savings = INR 100 crores * 25 bps * 92/365 (assuming 92 days in the 3 month period and 365 days for the year) = INR 6,30,137.

Settlement Amount = INR 6,30,137 / (1 + 7% * 92/365) = INR 6,19,212

Interest Rate Futures

Assume that ABC hold GOI securities, hence is exposed to the risk of rising interest rates, which in turn results in the reduction in the value of their portfolio. So in order to protect against a fall in the value of their portfolio due to falling bond prices, they can take short position in IRF contracts.

Example:

Date: 01-April-2017

Spot price of GOI Security: Rs 100.05

Futures price of IRF Contract: Rs 100.12

On 01-April-2017 ABC bought 2000 GOI securities from spot market at Rs 100.05. He anticipates that the interest rate will rise in near future. Therefore to hedge the exposure in underlying market he may sell May 2017 Interest Rate Futures contracts at Rs. 100.12.

On 16-May-2017 due to increase in interest rate:

Spot price of GOI Security: Rs 99.24

Futures Price of IRF Contract: Rs 99.28

Loss in underlying market will be $(99.24 - 100.05) * 2000 = \text{Rs } 1620$

Profit in the Futures market will be $(99.28 - 100.12) * 2000 = \text{Rs } 1680$

Certain risks are inherent to Derivative strategies viz. lack of opportunities, inability of Derivatives to correlate perfectly with the underlying and execution risks, whereby the rate seen on the screen may not be the rate at which the transaction is executed. For details of risk factors relating to use of Derivatives, the investors are advised to refer to Scheme Specific Risk Factors.

Concept of Macaulay Duration

Macaulay duration measures the average time that would be taken to receive the cash flows from the invested instrument. It is the weighted average term to maturity of the cash flows from an instrument. The weight of each cash flow is determined by dividing the present value of the cash flow by the price. Macaulay duration is a measure of interest rate sensitivity of a fixed income instrument. Higher the Macaulay duration, higher would be the interest rate risk.

Macaulay duration of a portfolio is the asset weighted average of the Macaulay duration of individual bonds / securities in the portfolio. The table below illustrates the calculation of portfolio Macaulay duration.

| Portfolio | Amount (crores) | % of portfolio (A) | Macaulay Duration (B) | Weighted Average (C) = (A*B) |
|--------------|-----------------|--------------------|------------------------------------|------------------------------|
| Instrument 1 | 10 | 33.33% | 2 | 0.67 |
| Instrument 2 | 10 | 33.33% | 3 | 1.00 |
| Instrument 3 | 10 | 33.33% | 4 | 1.33 |
| Total | 30 | 100% | Portfolio Macaulay Duration | 3[#] |

#Sum of column C

Macaulay Duration - Calculation

$$\text{Macaulay Duration} = \frac{\sum_{t=1}^n \frac{t * C}{(1+y)^t} + \frac{n * M}{(1+y)^n}}{\text{Current Bond Price}}$$

Where:

- t = respective time period
- C = periodic coupon payment
- y = periodic yield
- n = total number of periods
- M = maturity value
- Current Bond Price = Present value of cash flows

Key Assumptions

1. Macaulay Duration measures interest rate risk accurately only for instruments where cash flows do not change with change in the yield (i.e. for plain vanilla instruments and not for instruments with embedded options).
2. Macaulay Duration assumes yield curve is flat and so cash flows are reinvested at constant YTM rate over the instrument's period.
3. Macaulay Duration does not consider the fact that duration does not remain constant and duration changes with level of YTM rates.

Example Calculation

Assume a bond paying 10% coupon, matures in three years. Yield to maturity is at 10%. The bond pays coupon annually, and pays the principal on the final payment. Given this, the following cash flows are expected over the next three years:

| Period | Cash flow |
|--------|-----------|
| Year 1 | Rs.100 |
| Year 2 | Rs.100 |
| Year 3 | Rs.1100 |

With the periods and the cash flows known, a discount factor must be calculated for each period. This is calculated as $1 / (1 + r)^n$, where r is the interest rate and n is the period number in question. Thus the discount factors would be:

| Period | Discount Factor Formula | Results |
|--------|-------------------------|---------|
| Year 1 | $1 / (1 + 10\%)^1$ | 0.909 |
| Year 2 | $1 / (1 + 10\%)^2$ | 0.826 |
| Year 3 | $1 / (1 + 10\%)^3$ | 0.751 |

Next, multiply the period's cash flow by the period number and by its corresponding discount factor to find the present value of the cash flow:

| Period | Weighted Present Value of Cash flow | Results |
|------------|-------------------------------------|---------------------------|
| Year 1 | $1 * \text{Rs.}100 * 0.909$ | 90.9 |
| Year 2 | $2 * \text{Rs.}100 * 0.826$ | 165.3 |
| Year 3 | $3 * \text{Rs.}1100 * 0.751$ | 2479.3 |
| Sum | | 2735.5 (numerator) |

Sum of PV Cash Flows = $100/(1 + 10\%)^1 + 100/(1 + 10\%)^2 + 1100/(1 + 10\%)^3 = \text{Rs.}1000$ (denominator)

Macaulay duration = Rs.2735.5 / Rs.1000 = 2.74

Portfolio Turnover:

The Scheme being an open-ended Scheme, it is expected that there would be a number of Subscriptions and Redemptions on a daily basis. Further, in the debt market, trading opportunities may arise due to changes in system liquidity, interest rate policy announced by RBI, shifts in the yield curve, credit rating changes or any other factors. In the opinion of the fund manager these opportunities can be played out to enhance the total return of the portfolio, which will result in increase in portfolio turnover. There may be an increase in transaction cost such as brokerage paid, if trading is done frequently. However, the cost would be negligible as compared to the total expenses of the Scheme. Frequent trading may increase the profits which will offset the increase in costs. The fund manager will endeavour to optimize portfolio turnover to maximize gains and minimize risks keeping in mind the cost associated with it. However, it is difficult to estimate with reasonable measure accuracy, the likely turnover in the portfolio of the Scheme. The Scheme has no specific target relating to portfolio turnover.

Fixed Income Markets in India

The Fixed Income markets in India can be broken down into three parts:

1. Debt Market.
2. Money Market.
3. Derivatives Market.

Debt Market: The debt market is active since the mid 1990s with the introduction of major reforms in the debt market such as the auction system for sale of dated government securities, establishing the system of primary dealers to name a few reforms. This market is predominantly gilt oriented and

corporate papers became a part of it since late 1990s. Even today, the Government Securities (G-sec) segment is the largest segment in the debt market with a market capitalization of Rs. 5103753.99 crore in Dec 2017 up from Rs. 3164262.50 crore in Dec 2012. The Government securities market had a volume of Rs. 737,123 crore in Dec 2017 up from Rs. 408,211 crore in Dec 2012 (Source: The Clearing Corporation of India Ltd.).

The debt market consists of the following instruments:

- Government securities – Issued by the Government of India.
- State government securities – Issued by the State Government.
- Debt securities – Issued by various Corporate, Banks, Financial Institutions.
- Other approved securities like government guaranteed papers.

The nature of instruments is in the form of plain vanilla bonds, Floaters, Zero coupon bonds/deep discounted bonds, securitized papers and structured debt papers.

The major players in Indian debt market are Banks, Mutual Funds, Financial Institutions, Foreign Portfolio Investors, Primary Dealers, Insurance companies and others.

Money Market: The money market is a key component of the financial system as it is the fulcrum of monetary operations conducted by the Central Bank in its pursuit of monetary policy objectives. It is a market for short-term funds with maturity ranging from overnight to one year and includes financial instruments that are deemed to be close substitutes of money. Money market instruments facilitate borrowing for relatively short periods of time. They are generally issued at a discount to the maturity value.

The money market in India mainly consists of the following instruments:

- Call money market.
- Collateralized Borrowing & Lending obligation (CBLO).
- Treasury bills.
- Commercial papers.
- Certificates of deposits.
- Short Non-Convertible Debentures-fixed and floaters and term lending instruments.

RBI has been taking active steps to develop the money market in India with the objective to improve the signaling mechanism for monetary policy while ensuring financial stability. Various reform measures have resulted in a relatively deep, liquid and vibrant money market with a shift from administered and direct to indirect market based instruments of monetary management. For e.g. the call money market was transformed into a pure interbank market, while other money market instruments such as market repo and CBLO were developed to provide avenues to non-banks, including mutual funds, for managing their short-term liquidity mismatches. For the fortnight ended 31st Dec 2017, the total amount outstanding of commercial papers (at face value) issued was Rs. 4090.5 billion, whereas the total amount outstanding of certificates of deposits issued by Banks was Rs. 1269.8 billion for the fortnight ended 22nd Dec 2017 (Source-RBI).

The yield ranges (as on Jan 22, 2018) of various instruments mentioned above, and the factors affecting prices of such securities are given hereunder:

| Instrument | Current Yield range (%) |
|------------|-------------------------|
| CBLO | 5.80%-6.00% |
| Repo | 5.80%-6.00% |
| 3m Tbill | 6.30%-6.40% |

| | |
|----------------------------|-------------|
| 1YTbill | 6.45%-6.50% |
| 10Y Gsec | 7.20%-7.30% |
| 3m PSU Bank CD | 7.20%-7.30% |
| 3m Manufacturing Co. CP | 7.50%-7.60% |
| 1YPSU Bank CD | 7.40%-7.50% |
| 1YNBFC CP | 8.00%-8.15% |
| 1YManufacturing Co. CP | 7.70%-7.80% |
| 5Y AAA Institutional Bond | 7.70%-7.80% |
| 10Y AAA Institutional Bond | 7.85%-7.95% |

These yields are indicative and do not indicate yields that may be obtained in future as interest rates keep changing consequent to changes in macroeconomic conditions and RBI policy. The price and yield on various debt instruments fluctuate from time to time depending upon the macro economic situation, inflation rate, overall liquidity position, foreign exchange scenario etc. Also, the price and yield vary according to maturity profile, credit risk etc.

Derivative market: Derivatives markets have grown over the year. There are mainly three types of derivatives in the Indian market.

1. **Interest Rate Swap** - An Interest Rate Swap (“IRS”) is a financial contract between two parties exchanging or swapping a stream of interest payments for a “notional principal” amount on multiple occasions during a specified period.
2. **Forward Rate Agreement** - A Forward Rate Agreement (“FRA”) is a financial contract between two parties to exchange interest payments for a notional principal amount on settlement date, for a specified period from start date to maturity date.
3. **Interest Rate Futures:** A futures contract is a standardized, legally binding agreement to buy or sell a commodity or a financial instrument in a designated future month at a market determined price (the futures price) by the buyer and seller.

Risk Control:

Risk is an inherent part of the investment function. Effective risk management is critical to fund management for achieving financial soundness. Since investing requires disciplined risk management, the AMC would incorporate adequate safeguards for controlling risks in the portfolio construction process. The risk control process involves reducing risks through portfolio diversification; The AMC believes that this diversification would help achieve the desired level of consistency in returns. The AMC aims to identify securities, which offer superior levels of yield at lower levels of risks. With the aim of controlling risks, rigorous in-depth credit evaluation of the securities proposed to be invested in will be carried out by the investment team of the AMC. Risk control would involve managing risk in order to keep it in line with the investment objective of the Scheme. AMC has implemented the Miles Fundware as Front Office System (FOS) for this purpose The system has incorporated all the investment restrictions as per SEBI guidelines and “soft” warning alerts at appropriate levels for preemptive monitoring.

The system enables identifying & measuring the risk through various risk measurement tools like various risk ratios, average duration and analyzes the same and acts in a preventive manner.

Investments by the AMC in the Scheme

Subject to the Regulations and to the extent permitted by SEBI from time to time, the AMC may invest in the Scheme. However, the AMC will not charge investment management fee on such investment in the Scheme.

Further, in accordance with Regulation 28(4) of the SEBI (Mutual Funds) Regulations 1996, inserted by Gazette Notification No. LAD/NRO/GN/2014-15/01 dated May 06, 2014 the AMC has invested in the Direct Plan – Growth option of the Scheme and such investment will not be redeemed unless the Scheme is wound up.

F. FUNDAMENTAL ATTRIBUTES

G. HOW WILL THE SCHEME BENCHMARK ITS PERFORMANCE?

CRISIL Liquid Fund Index.

Justification for use of benchmark

A benchmark of a fund reflects the funds risk/return profile and is a measure for performance evaluation. The Scheme intends to invest in a portfolio of securities and the risk/return profile which is best captured by the following selected benchmark.

CRISIL Liquid Fund Index developed by CRISIL, fulfills the above criteria's and hence is considered best suited as a benchmark for the Scheme for performance evaluation.

The constituents and weights of CRISIL Liquid Fund Index are as under:

| Constituents | Applicable from May 2017 Weight |
|-------------------------|---------------------------------|
| CRISIL CBLO Index | 15% |
| CRISIL 2 Month CP Index | 17% |
| CRISIL 2 Month CD Index | 18% |
| CRISIL 3 Month CP Index | 23% |
| CRISIL 3 Month CD Index | 27% |
| Total | 100% |

The Trustee reserves the right to change the benchmark for the evaluation of the performance of the Scheme from time to time, keeping in mind the investment objective of the Scheme and the appropriateness of the benchmark, subject to the Regulations and other prevalent guidelines.
